Abstract.

Gear is one of the most important part of power transmission system in a vehicle, and as the time goes by there possibly some failure happened on the gears. However, there is no information provided by car manufacturer regarding the life and the material of the gears. This report presents the analysis of the planetary gear used in Toyota Rush AT year made of 2012. The objectives of the research are: to study the planetary gear mechanism and how it works; to analyze the force and stress acting on the gears; and to select a suitable gear material that can withstand against the loads that happen on the gear. The research methodology is started with finding the gear dimension and gear ratio. The force acting on gear is calculated based on the torque and rotation speed provided in car specification. Then the selection material is carried out based on the amount of stress applied on the gear teeth that were calculated using AGMA standard formulation. Finally, the fatigue life prediction of the gears is calculated based on the previous stress acting on the gears. The calculation result suggested AISI 1050 steel as the selected gear material that can carry the bending stress of 476 MPa and categorized as low to high fatigue cycle.

Keywords: planetary gear, ring gear, sun gear.

Introduction

Background.

There is a view kind of gears, one of them is planetary gear. This kind of gear has the first component, which is ring gear, Pinion gear, and sun gear. This kind of gear usually can be seen on automatic transmission car. With the gear design that always been attach to produce friction that is
more minimum than the other design set gear conventional, so small there is less possibility of the gear to be worn out.

In this thesis researcher will be focusing on the gear that is on the gear planetary on the automatic transmission car. Basically, the manufacturer is not giving the detail information about the material that is used on the gear. Hopefully with this research people will be aware of the material that is used.

Problem Statement.

1. How the mechanism and how it work on planetary gear?
2. How the condition of the gear that is causes by force that’s happen on planetary gear?
3. What kind of material that is right to be use on planetary gear?

Objective.

1. To study the planetary gear mechanism and how it works.
2. To analyze the force and bending stress acting on gear using AGMA standard equation.
3. To select the gear material that can withstand against bending stress that happen on the gear.

Limitations.

2. This research is only using the planetary gear of Toyota Rush 2012 AT car.
3. The gear that is use in this research is helical gear
4. How the vehicle works is not consider as reference.
5. Comparison of the material only for acknowledging the strength between material, not cunt as the cost if using material that is been decided as comparison.

Literature Review

Gears.

Gears are among the most important power transmission elements. A gear is a rotating machine element having cut teeth which mesh with another toothed part, usually having teeth of similar size and shape, in order to transmit power. Two or more gears working together are called a “transmission” (or gear set) and can produce “mechanical advantage” and thus may be considered a simple machine. The mechanical advantage is a measure of the force or torque amplification that is obtained using mechanical devices.

Types of gears: spur gear, helical gear, bevel gear, worm gear, and planetary gear.

Planetary gear.

1. Planetary trains include three main components: a sun gear, a planet carrier with one or more planet gears on it, and a ring gear.
2. Planetary trains have two or more degrees of freedom and thus have two or more inputs.
3. Planetary gear trains are commonly used for obtaining different gear ratios by fixing one of the elements (the sun, the ring, or the planet carrier) and using one of the remaining two elements as an input and the other as an output.
Contact Ratio

The contact ratio “mc” defines the average number of teeth pairs in contact during meshing.

1. If $mc = 1$ it means that only one pair of teeth is in contact at a time.
2. To reduce noise and possibility of impact it is recommended that $mc \geq 1.2$
3. The contact ratio increases with the number of teeth of a gear and for this reason, gears having less than ten teeth are not commonly used.

Helical Gear.

On helical gears, the teeth are inclined at an angle with the axis, that angle being called the helix angle. If the gear were very wide, it would appear that the teeth wind around the gear blank in a continuous, helical path. Helical gears have different pitches:

1. Circular pitch, $p$. Circular pitch is the distance from a point on one tooth to the corresponding point on the next adjacent tooth, measured at the pitch line in the transverse plane.
2. Normal circular pitch, $P_a$. Normal circular pitch is the distance between corresponding points on adjacent teeth measured on the pitch surface in the normal direction.
3. Diametral pitch, $P_d$. Diametral pitch is the ratio of the number of teeth in the gear to the pitch diameter.
4. Normal diametral pitch, $P_{nd}$. Normal diametral pitch is the equivalent diametral pitch in the plane normal to the teeth.

Forces, Torque and Power in Gearing.

\[
Torque = \frac{Power}{Rotational Speed} = \frac{P}{n}
\]
\[ T = W_t(R) = W_t \left( \frac{D}{2} \right) = \frac{P}{n} \]

\[ P = W_t \times v_t \]

**Gear Quality.**

Factors of gear quality: index variation, tooth alignment, tooth profile and root radius.

Stress in Gear Teeth.

1. Bending stress number
   \[
   \sigma_b = \frac{W_t P_d K_o K_s K_m K_v K_b}{b_w Y_j}
   \]
   Where \( W_t \) is tangential force, \( P_d \) is diametral pitch of the tooth, \( Y_j \) is geometric factor, \( K_o \) is overload factor for bending strength, \( K_s \) is size factor for bending strength, \( K_m \) is load distribution factor for bending strength, \( K_v \) is rim thickness factor and \( K_b \) is dynamic factor for bending strength.

2. Overload factor, \( K_o \)
   Suggested overload factors, \( K_o \):

3. Size Factor, \( K_s \)
   Suggested size factors, \( K_s \)

4. Load Distribution Factor, \( K_m \)
   Formula to calculate load distribution factor:
   \[
   K_m = 1 + C_{mc}(C_{pf} \times C_{pm} + C_{ma} \times C_e)
   \]
   Where: \( C_{mc} \) is lead correction factor (\( C_{mc} \) is 1.0 for uncrowned teeth and 0.8 for crowned teeth), \( C_{pf} \) is pinion proportion factor, \( C_{pm} \) is pinion proportion modifier (see figure below), \( C_{ma} \) is mesh alignment factor, and \( C_e \) is mesh alignment correction factor.
If $b_w < 25$ mm: $C_{pf} = \frac{b_w}{10d_p} - 0.025$

For $25$ mm $< b_w < 432$ mm: $C_{pf} = \frac{b_w}{10d_p} - 0.0375 + 0.000492b_w$

For $432$ mm $< b_w \leq 1020$ mm: $C_{pf} = \frac{b_w}{10d_p} - 0.1109 + 0.000815b_w - (3.53 \times 10^{-7})b_w^2$

Pinion proportion modifier: $C_{pm}=1.0$ (for $S_1/S<0.175$) or $1.1$ (for $S_1/S\geq0.175$).

Mesh alignment correction factor: $C_e=0.80$ (when gearing is adjusted at assembly or when compatibility between gear teeth is improved by lapping) or 1.0 (for all other conditions).

Mesh alignment factor: $C_{ma} = A + Bb_w + Cb_w^2$

5. Dynamic Factor, $K_v$

Equation for dynamic factor:

Where $C=1$ for $vt$ in ft/min, $C=\sqrt{200}=14.14$ for $vt$ in m/s and $A=50+56(1.0-B)$. 
6. Rim Thickness Factor, $K_b$

**Fatigue Life Cycle.**

Finite life. Low cycle fatigue ($10^0 < N < 10^3$) and high cycle fatigue ($N \geq 10^3$). Infinite life ($N > 10^{6-7}$).

The correlation between $S$ & $N$ in high cycle region can be obtained based on equation of the line:

$$B = \left(-\frac{1}{3}\right) \times \log\left(\frac{0.8S_{ut}}{S_e}\right)$$

$$C = \log\left[(0.8S_{ut})^2/S_e\right]$$

$$N = 10^{-\frac{C}{b}} \times S_a^{\frac{1}{b}}$$
Research Methodology

Research Framework.

Observation.
Planetary gear to analyze from Toyota Rush AT 2012 with specification:

Power: 109 hp = 81215.9 W = 81.2159 kW

ωSUN: 6000 rpm = 628.3185 rad/s

Torque: 129.2591 Nm

Module: 1.25 mm = 0.00125 m

Gear angle: 20° = 0.349

Gear Dimension.

1. Sun Gear

   NSUN: 26
   Diametre (Dp): NSUN x Module = 32.5 mm = 0.0325 m
   Width (b): 22mm = 0.022m
   Face Width (bw): b/cosφ = 23.41mm = 0.02341 m
   Rim thickness (tr): 0.5
   Teeth height (ht): 0.317

2. Planet 1 Gear

   NPLANET: 20
   Diametre (Dp): NPLANET x Module = 25 mm = 0.025 m
   Width (b): 22mm = 0.022m
   Face Width (bw): b/cosφ = 23.41mm = 0.02341 m
   Rim thickness (tr): 0.5
   Teeth height (ht): 0.317
3. Planet 2 Gear
   \( N_{\text{PLANET}}: 20 \)
   Diameter (Dp): \( N_{\text{PLANET}} \times \text{Module} = 25 \text{ mm} = 0.025 \text{ m} \)
   Width (b): 39 mm = 0.039m
   Face Width (bw): \( b/\cos\emptyset = 41.5 \text{ mm} = 0.0415 \text{ m} \)
   Rim thickness (tr): 0.5
   Teeth height (ht): 0.317

4. Ring Gear
   \( N_{\text{PLANET}}: 71 \)
   Diameter (Dp): \( N_{\text{RING}} \times \text{Module} = 88.75 \text{ mm} = 0.08875 \text{ m} \)
   Width (b): 27 mm = 0.027m
   Face Width (bw): \( b/\cos\emptyset = 28.73 \text{ mm} = 0.02873 \text{ m} \)
   Rim thickness (tr): 0.5
   Teeth height (ht): 0.317

**Gear Ratio.**

Gear ratio is comparison between \( \omega_{\text{output}} \) and \( \omega_{\text{input}} \). \( \omega_{\text{output}} \) is Ring gear and \( \omega_{\text{input}} \) is Sun Gear.

\[
D_{\text{RING}} = N_{\text{RING}} \times \text{Module} \\
D_{\text{SUN}} = N_{\text{SUN}} \times \text{Module} \\
D_{\text{PLANET}} = N_{\text{PLANET}} \times \text{Module} \\
\omega_{\text{SUN}} = 6000 \text{ rpm} = 628.3185 \text{ rad/s} \\
\text{Power: } 109 \text{ hp} = 81215.9 \text{ W} = 81.215 \text{ kW}
\]

\[
V_{\text{SUN}} = V_{\text{PLANET}} = V_{\text{RING}} \\
\omega_{\text{RING}} = \frac{V_{\text{RING}}}{\tau_{\text{RING}}} \\
\omega_{\text{PLANET}} = \frac{V_{\text{PLANET}}}{\tau_{\text{PLANET}}} \\
\text{Gear ratio} = \frac{\omega_{\text{RING}}}{\omega_{\text{SUN}}}
\]

**Force Acting on Gear.**

\[
T_{\text{SUN}} = \frac{P}{\omega_{\text{SUN}}} \\
F_{\text{SUN}} = \frac{T_{\text{SUN}}}{\tau_{\text{SUN}}} = \frac{2T_{\text{SUN}}}{D_{\text{SUN}}} \\
T_{\text{RING}} = \frac{P}{\omega_{\text{RING}}} \\
F_{\text{RING}} = \frac{T_{\text{RING}}}{\tau_{\text{RING}}} = \frac{2T_{\text{RING}}}{D_{\text{RING}}} \\
T_{\text{PLANET}} = \frac{P}{\omega_{\text{PLANET}}}
\]
Analyzing of Planetary Gear.

1. Sun Gear
   Bending stress equation:
   \[
   \sigma_b = \frac{W_t P_d K_o K_s K_m K_v K_b}{b_w Y_j}
   \]

   Given: Pd is 800 m^{-1}, dp is 32.5 mm, b is 22 mm, Y_j is 0.35, K_o is 2 (moderate shock), K_s is 1 (recommended values of size factor if module <5 mm), C_mc is 1 (for uncrowned teeth), C_pm is 1 (recommended values if (S_1/S) < 0.175), C_e is 1 (for all other conditions), t_R is 0.5, and h_t is 0.317.

   Solution:
   Transmitted load:
   \[
   W_t = \frac{T}{\frac{1}{2} dp}
   \]
   \[
   b_w = \frac{b}{\sin \theta}
   \]

   Load distribution factor:
   \[
   K_m = 1 + C_{mc}(C_pf \times C_{pm} + C_{ma} \times C_e)
   \]

   Find out C_pf and C_ma:
   \[
   C_pf = \frac{b_w}{10 \times dp} - 0.025
   \]
   \[
   C_ma = A + B b_w + C b_w^2
   \]

   Thus
   \[
   C_{ma} = 0.0675 + 5.04 \times 10^{-4} \times 0.023412 \pm 1.44 \times 10^{-7} \times 0.023412^2
   \]

   Dynamic factor:
   \[
   K_v = \left(\frac{A + C \sqrt{vt}}{A}\right)^B
   \]

   From AGMA bending stress equation table:
   \[
   A = 50 + 56(1 - B)
   \]
   \[
   B = 0.25(12 - Q_v)^{0.667}
   \]
   \[
   C = 14.14 \text{ for } vt \text{ in } \frac{m}{s}
   \]

   Q_v is 11 (for automotive transmission)
Rim thickness factor:

\[ K_b = -2m_b + 3.4 \]
\[ m_b = \frac{r_R}{h_t} \]

2. Planet 1 Gear
AGMA bending stress equation:

\[ \sigma_b = \frac{W_fP_dK_oK_sK_mK_vK_p}{b_wY_j} \]

Given: \( P_d \) is 800 m\(^{-1} \), \( dp \) is 25 mm, \( b \) is 22 mm, \( Y_j \) is 0.35, \( K_o \) is 1 (power source: uniform), \( K_s \) is 1 (recommended values of size factor if module <5 mm), \( C_{mc} \) is 1 (for uncrowned teeth), \( C_{pm} \) is 1 (recommended values if \( (S_i/S) < 0.175 \)), \( C_e \) is 1 (for all other conditions), \( t_R \) is 0.5, \( h_i \) is 0.317, and \( K_b \) is 1 (conventional gear).

Solution:

\[ W_t = \frac{T}{\frac{1}{2}dp} \]
\[ b_w = \frac{b}{\sin \theta} \]

Load distribution factor:

\[ K_m = 1 + C_{mc}(C_{pf} \times C_{pm} + C_{ma} \times C_e) \]

Find out \( C_{pf} \) and \( C_{ma} \):

\[ C_{pf} = \frac{b_w}{10 \times dp} - 0.025 \]
\[ C_{ma} = A + Bbw + Cbw^2 \]

Dynamic factor:

\[ K_v = \left( \frac{A + C\sqrt{vt}}{A} \right)^B \]

From AGMA bending stress equation table:

\[ A = 50 + 56(1 - B) \]
\[ B = 0.25(12 - Q_v)^{0.667} \]
\[ C = 14.14 \text{ for } vt \text{ in } \frac{m}{s} \]

\( Q_v \) is 11 (for automotive transmission)

3. Planet 2 Gear
AGMA bending stress equation:

\[ \sigma_b = \frac{W_fP_dK_oK_sK_mK_vK_p}{b_wY_j} \]

Given: \( P_d \) is 800 m\(^{-1} \), \( dp \) is 25 mm, \( b \) is 39 mm, \( Y_j \) is 0.35, \( K_o \) is 1 (power source: uniform), \( K_s \) is 1 (recommended values of size factor if module <5 mm), \( C_{mc} \) is 1 (for uncrowned teeth), \( C_{pm} \)
is 1 (recommended values if \((S_i/S) < 0.175\)), \(C_e\) is 1 (for all other conditions), \(t_R\) is 0.5, \(h_t\) is 0.317, and \(K_b\) is 1 (conventional gear).

Solution:

\[
W_t = \frac{T}{\frac{1}{2} dp}
\]

\[
bw = \frac{b}{\sin \theta}
\]

Load distribution factor:

\[
K_m = 1 + C_{mc}(C_{pf} \times C_{pm} + C_{ma} \times C_e)
\]

Find out \(C_{pf}\) and \(C_{ma}\):

\[
C_{pf} = \frac{bw}{10 \times dp} - 0.025
\]

\[
C_{ma} = A + B bw + Cbw^2
\]

Dynamic factor:

\[
K_v = \left(\frac{A + C\sqrt{vt}}{A}\right)^B
\]

From AGMA bending stress equation table:

\[
A = 50 + 56(1 - B)
\]

\[
B = 0.25(12 - Q_v)^{0.667}
\]

\[
C = 14.14 \text{ for vt in} \frac{m}{s}
\]

\(Q_v\) is 11 (for automotive transmission)

4. Ring Gear

AGMA bending stress equation:

\[
\sigma_b = \frac{W_t P_d K_o K_s K_m K_v K_p}{b_w Y_j}
\]

Given: \(P_d\) is 800 m\(^{-1}\), \(dp\) is 88.75 mm, \(b\) is 27 mm, \(Y_j\) is 0.35, \(K_o\) is 1 (power source: uniform), \(K_s\) is 1 (recommended values of size factor if module <5 mm), \(C_{mc}\) is 1 (for uncrowned teeth), \(C_{pm}\) is 1 (recommended values if \((S_i/S) < 0.175\)), \(C_e\) is 1 (for all other conditions), \(t_R\) is 0.5, \(h_t\) is 0.317, and \(K_b\) is 1 (conventional gear).

Solution:

\[
W_t = \frac{T}{\frac{1}{2} dp}
\]

\[
bw = \frac{b}{\sin \theta}
\]
Load distribution factor:

\[ K_m = 1 + C_{mc}(C_{pf} \times C_{pm} + C_{ma} \times C_e) \]

Find out \( C_{pf} \) and \( C_{ma} \):

\[ C_{pf} = \frac{bw}{10 \times dp} - 0.025 \]

\[ C_{ma} = A + Bbw + Cbw^2 \]

Dynamic factor:

\[ K_v = \left( \frac{A + C\sqrt{vt}}{A} \right)^B \]

From AGMA bending stress equation table:

\[ A = 50 + 56(1 - B) \]

\[ B = 0.25(12 - Q_v)^{0.667} \]

\[ C = 14.14 \text{ for } vt \text{ in } \frac{m}{s} \]

\( Q_v \) is 11 (for automotive transmission)

Selecting Gear Material.

Selecting material is not consider cost material and cost manufacture.

Fatigue Life Cycle.

Given:

\[ T: 129.2591 \text{ Nm} \]

\[ D_{spring}: 0.08875 \text{ m} \]

\[ S_u: 655 \text{ MPa} \]

\[ S_c: 515 \text{ MPa} \]

\[ Addendum = 1 \times pitch \]

\[ Dedendum = 1.25 \times pitch \]
\[ R_d = \frac{D_p}{2} + \text{addendum} \]
\[ R_a = \frac{D_p}{2} - \text{dedendum} \]
\[ wt_{min} = \frac{T}{R_d} \]
\[ wt_{max} = \frac{T}{R_a} \]

Calculation for \( \sigma_{b\min} \) and \( \sigma_{b\max} \) in below:

\[ \sigma_{b\min} = \frac{wt_{min}P_dK_oK_sK_mK_vK_b}{b_wY_j} \]
\[ \sigma_{b\max} = \frac{wt_{max}P_dK_oK_sK_mK_vK_b}{b_wY_j} \]

Value for Pd, Ko, Ks, Km, Kv, Kb, bw and Yj is same as on chapter 3.1.5. The value from ring gear.

\[ Stress\ Amplitude\ S_a = \frac{\sigma_{b\max} - \sigma_{b\min}}{2} \]
\[ Mean\ Stress\ S_m = \frac{\sigma_{b\max} + \sigma_{b\min}}{2} \]

Cycle Curve:

\[ B = \left( -\frac{1}{3} \right) \times \log \left( \frac{0.8S_{ut}}{S_e} \right) \]
\[ C = \log \left( (0.8S_{ut})^2 / S_e \right) \]
\[ N = 10^{-\frac{c}{b}} \times S_d^{\frac{1}{b}} \]
S-N Curve:

![S-N Curve Image]

Based on results of existing calculation, the fatigue life cycle is categorized as low to high cycle. (N≈10^3).

For meshing gears the rotational motion and the power must be transmitted from the driving gear to the driven gear with a smooth and uniform positive motion and with minor frictional power loss. The fundamental law of gearing states that the common normal to the tooth profile at the point of contact must always pass through a fixed point, called the pitch point, in order to maintain a constant velocity...
ratio of the two meshing gear teeth. Since the velocity at this point must be the same for Contact Ratio and Gear Velocity.

\[ \text{Gear ratio} = \frac{\omega_{\text{RING}}}{\omega_{\text{SUN}}} = \frac{230 \text{ rad/s}}{628.3185 \text{ rad/s}} = 0.366 \]

Based on this result counted in gear ratio, got the torque in every gear. Within like that can be known Tring > Tsun > Tplanet. And the result in counted force in every gear can be get almost the same result.

</table>

\[
B = \left(-\frac{1}{3}\right) \times \log\left(\frac{0.8S_{ut}}{S_e}\right)
\]

\[
C = \log\left[(0.8S_{ut})^2/S_e\right]
\]

\[
N = 10^{-C} \times S_a^{1/B} = 4.47 \times 10^3 \text{ cycles}
\]

**Conclusion and Recommendation**

**Conclusion.**

1. Based on the data that have been collected on chapter 3, the biggest bending stress happen on the ring gear which is 476 MPa.
2. From the data collected in the research of planetary gear on Toyota rush AT 2012, it can be assumed that the used material is equivalent to AISI 1050 that has yield strength of 515 MPa.
3. By using AISI 1050 material, the fatigue life cycle is categorized as low to high cycle fatigue (N ≈10³).

**Recommendation.**

1. Can be use as comparison for making or re-design planetary gear as mentioned using the material that has yield strength more than AISI 1050 (515 MPa), with safety factor that have been used can be bigger. Yet have to be count on cost on material and production.
2. Using material with properties above AISI 1050 that has UTS (Ultimate Tensile Strength) hight will got fatigue cycle that is higher or can be categorized as infinite life cycle. The fact that is happened on the field, very rarely happen but once it happen to be broken on the gear is caused of failure by age factor of the vehicle itself.
